# Why cross-correlate?

- Access to **high-redshift** large-scale structure (LSS) information: dark energy, gravity, neutrinos, primordial non-Gaussianity
- Increased **robustness** in LSS cosmology: astrophysical and observational systematics

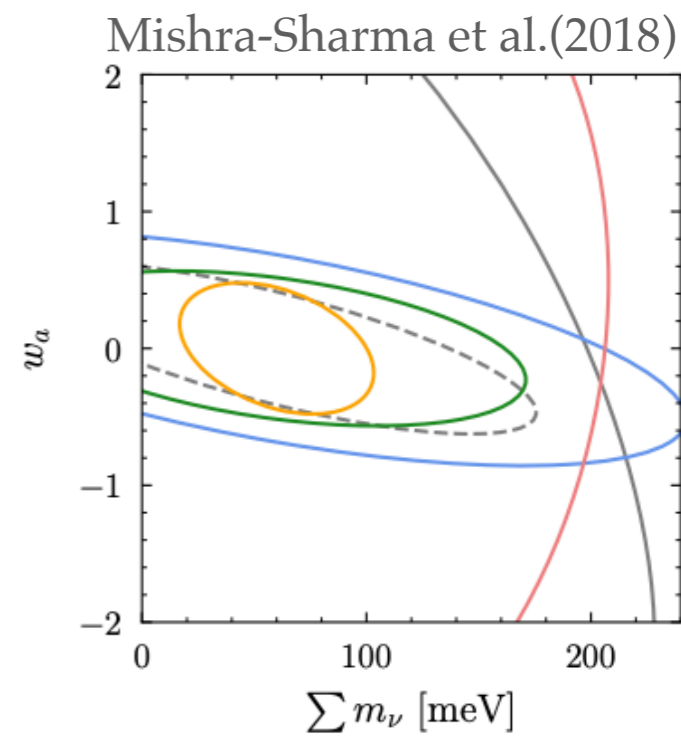

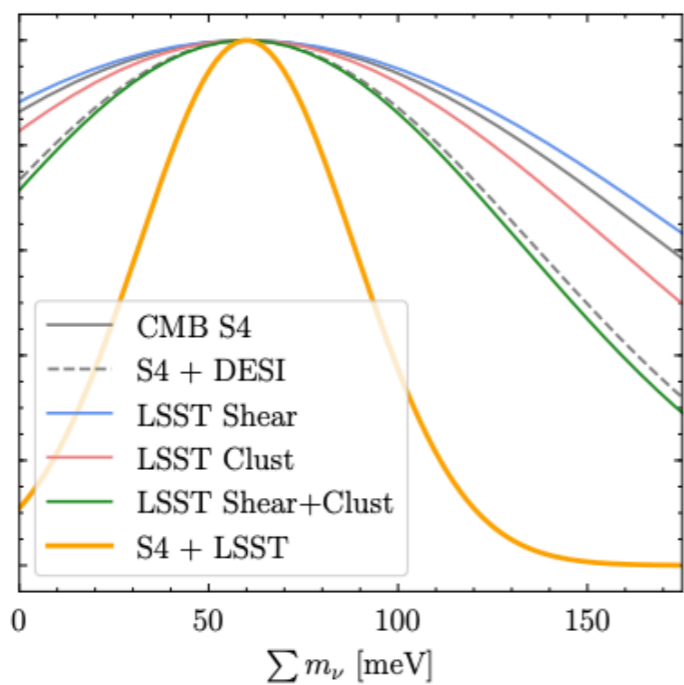

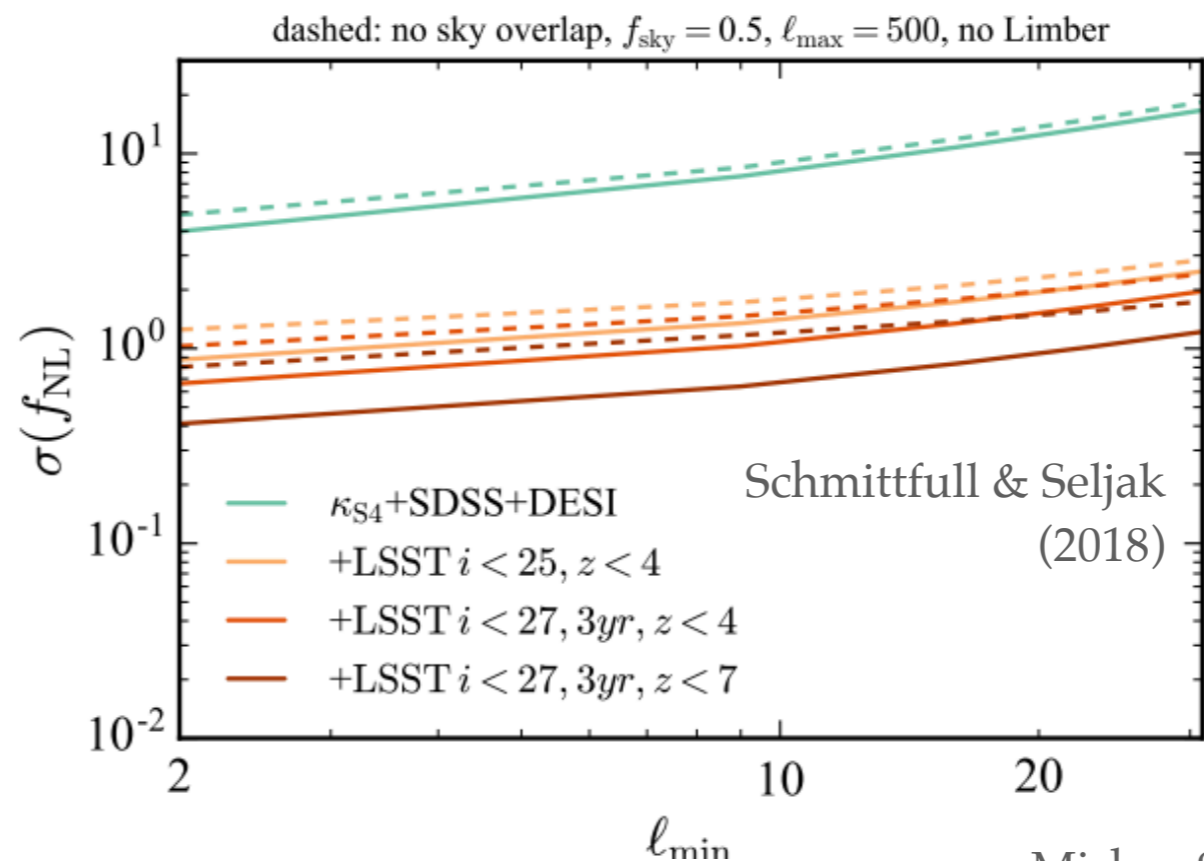

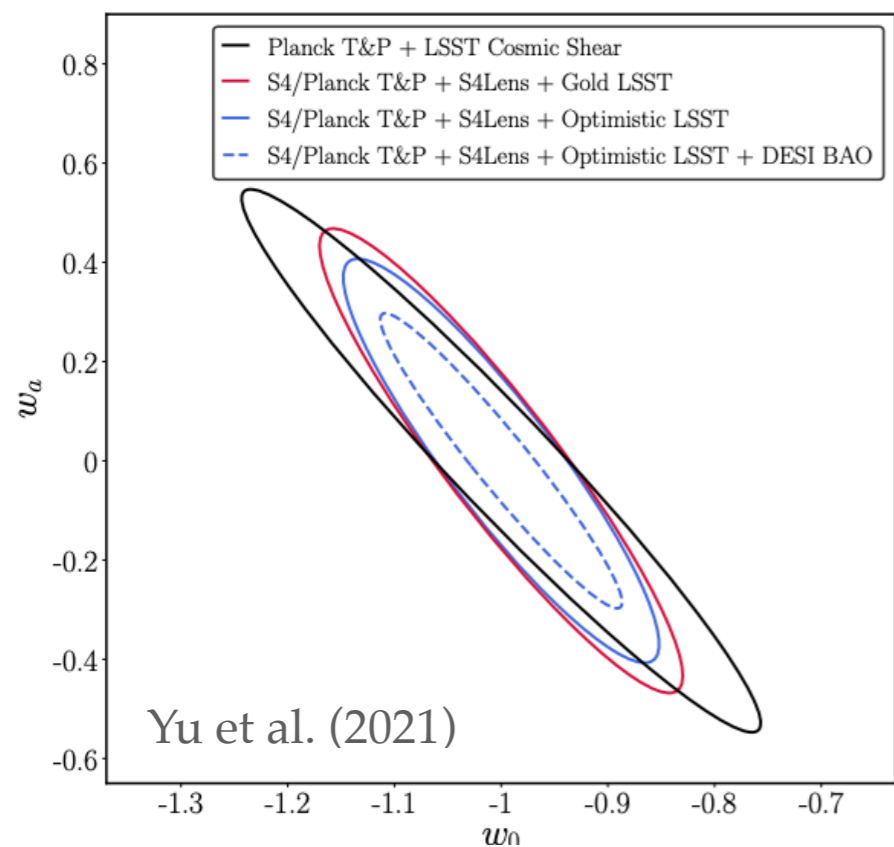

# Why cross-correlate?

- Access to **high-redshift** large-scale structure (LSS) information: dark energy, gravity, neutrinos, primordial non-Gaussianity
- Increased **robustness** in LSS cosmology: astrophysical and observational systematics

# It's promising!

# Where we are *now*

Current constraints are already competitive! But, devils are in the details... there are many things we learn from doing this with Stage-III data.

# Where we are *now*

Current constraints are already competitive! But, devils are in the details... there are many things we learn from doing this with Stage-III data.

- CMB lensing x galaxy surveys can now provide meaningful cosmological constraints
- Technological advances in analysis
- Need to improve on small-scale modeling
- We do not forecast surprises
- Cross-survey, cross-collaboration analyses takes real effort and real dedicated sources: joint simulations, joint analysis tools, cross-collaboration infrastructure

**Thanks!**
